## **Database Description:**

The "New Hampshire Continental Shelf Geophysical Database: 2016-2017 Field Campaign - Seafloor and Sample Photographs and Sediment Data " contains photographs of the seafloor from sampling locations, photographs of the sediment samples, and grain size data from a major field campaign conducted in 2016-2017 and from the UNH Ocean Engineering 972 Hydrographic Field Course classes in 2012, 2014, and 2018. In total, sixteen one-day cruises provided 150 samples for grain size analysis. The database provides complete descriptions for each sample including identification, station and sample characteristics, sediment classifications, grain size statistics, and grain size distribution. The grain size data is grouped by survey or location and the year when high-resolution multibeam echosounder bathymetry was run in that area. The Station IDs indicate the type of survey (e.g., SH stands for Summer Hydro) and/or location (NSBE), the year of the bathymetry survey (i.e., 06, 07, etc.), and the station number (e.g., T03, T04, etc. or S01, S02, etc.). Each sample has a "Reliability Ranking for Positioning" which gives an estimate of the uncertainty of the location of the sample classified from 1 to 4. Explanation of uncertainty and the numbering system is given in Ward et al. (2021). Briefly, the uncertainty is as follows: category 1 is <30m; category 2 is 30 to 50m; category 3 is 185 to 463m; and category 4 is 250 to 1000

The stations sampled during the New Hampshire Continental Shelf 2016-2017 Field Campaign were targeted at locations where there was high-resolution bathymetry available. The bathymetry includes MBES surveys conducted by the UNH CCOM/JHC Hydrographic Field Course (Ocean Engineering 972) (all GSH or SH), NOS surveys (NSBE), and lidar surveys by the USGS (Shoals) (see Ward et al., 2021). In this database the stations are grouped by survey or location and year the bathymetry survey was run. The Station IDs indicate the type of survey (e.g., SH, GSH, Shoals) and/or location (NSBE), the year of the bathymetry survey (i.e., 06, 07, etc.), and the station number (e.g., T03, T04, etc. or S01, S02, etc.). In total, sixteen one-day cruises provided 150 samples for grain size analysis.

Presented here are tables with the station locations and types of data available followed by single sample summaries for each sample collected and analyzed. Included in each summary are location information, seafloor photographs, photographs of the sample (in field and laboratory) where available, collection information, sediment classifications, grain size statistics, and grain size distribution. Samples were analyzed with standard sieve and pipette analyses after Folk (1980). The sediment grain size classifications include: CMECS (Coastal and Marine Ecological Classification Standard; FGDC, 2012); Gradistat (Blot and Pye, 2001); and Wentworth (Wentworth, 1922; described in Folk, 1954, 1980). Statistics are based on the phi scale and include the graphic mean, sorting, skewness, and kurtosis (Folk, 1980).
